Simple Cycle Test Validation of the **STEP Dynamic Simulation Model** Darryl Hino (GTI Energy)

8th International Supercritical CO₂ Power Cycles • February 27 – 29, 2024 • San Antonio, TX, USA

Supercritical CO₂ Power Cycles Symposium

System Modeling An Increasingly Valuable Tool

Steady state modeling

- Development
- Started Aspen Plus modeling ~12 years ago for system studies
- Continuous improvement with realistic pressure loss & equipment performance
- Cross verification w/other models
- Use
- Cycle performance, pipe sizing, equipment specification
- Evaluate other sCO2 cycles & applications

Dynamic modeling

- Development
- Created Flownex model to support STEP
- Use
- Provide feedback on piping & equipment designs
- Test controls narrative & methodology
- Operations planning (startup, normal shutdown, and trips/shutdowns)

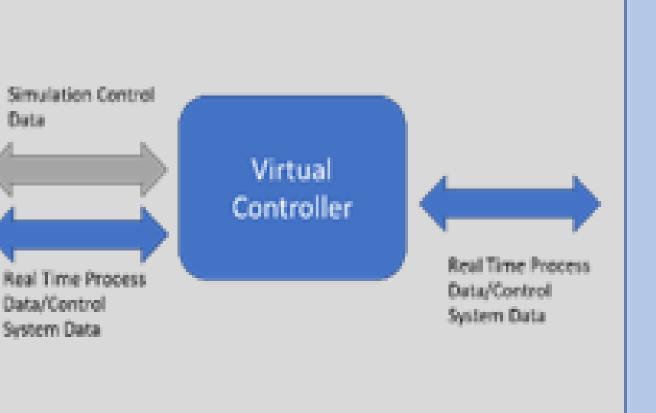

Models to be validated against STEP data for future use

The 8th International Supercritical CO₂ Power Cycles • February 27 – 29, 2024 • San Antonio, TX, USA

Facility simulator

Flownex model used for hardware physics Ties into a virtual controller accesses real time data Human machine interface mimics facility controls

Operator training – runs at real time

Steady state and transient analysis performed using Flownex software 2 models: one for Simple Cycle and one for RCBC configurations sCO2 properties are taken from NIST REFPROP Custom component models have been created and benchmarked against vendor predicted performance data Various transients have been analyzed, such as startup, shutdown, load level changes, and emergency trips Validation of the model will be performed as test data becomes available

Dynamic Modeling Configurations and Purpose

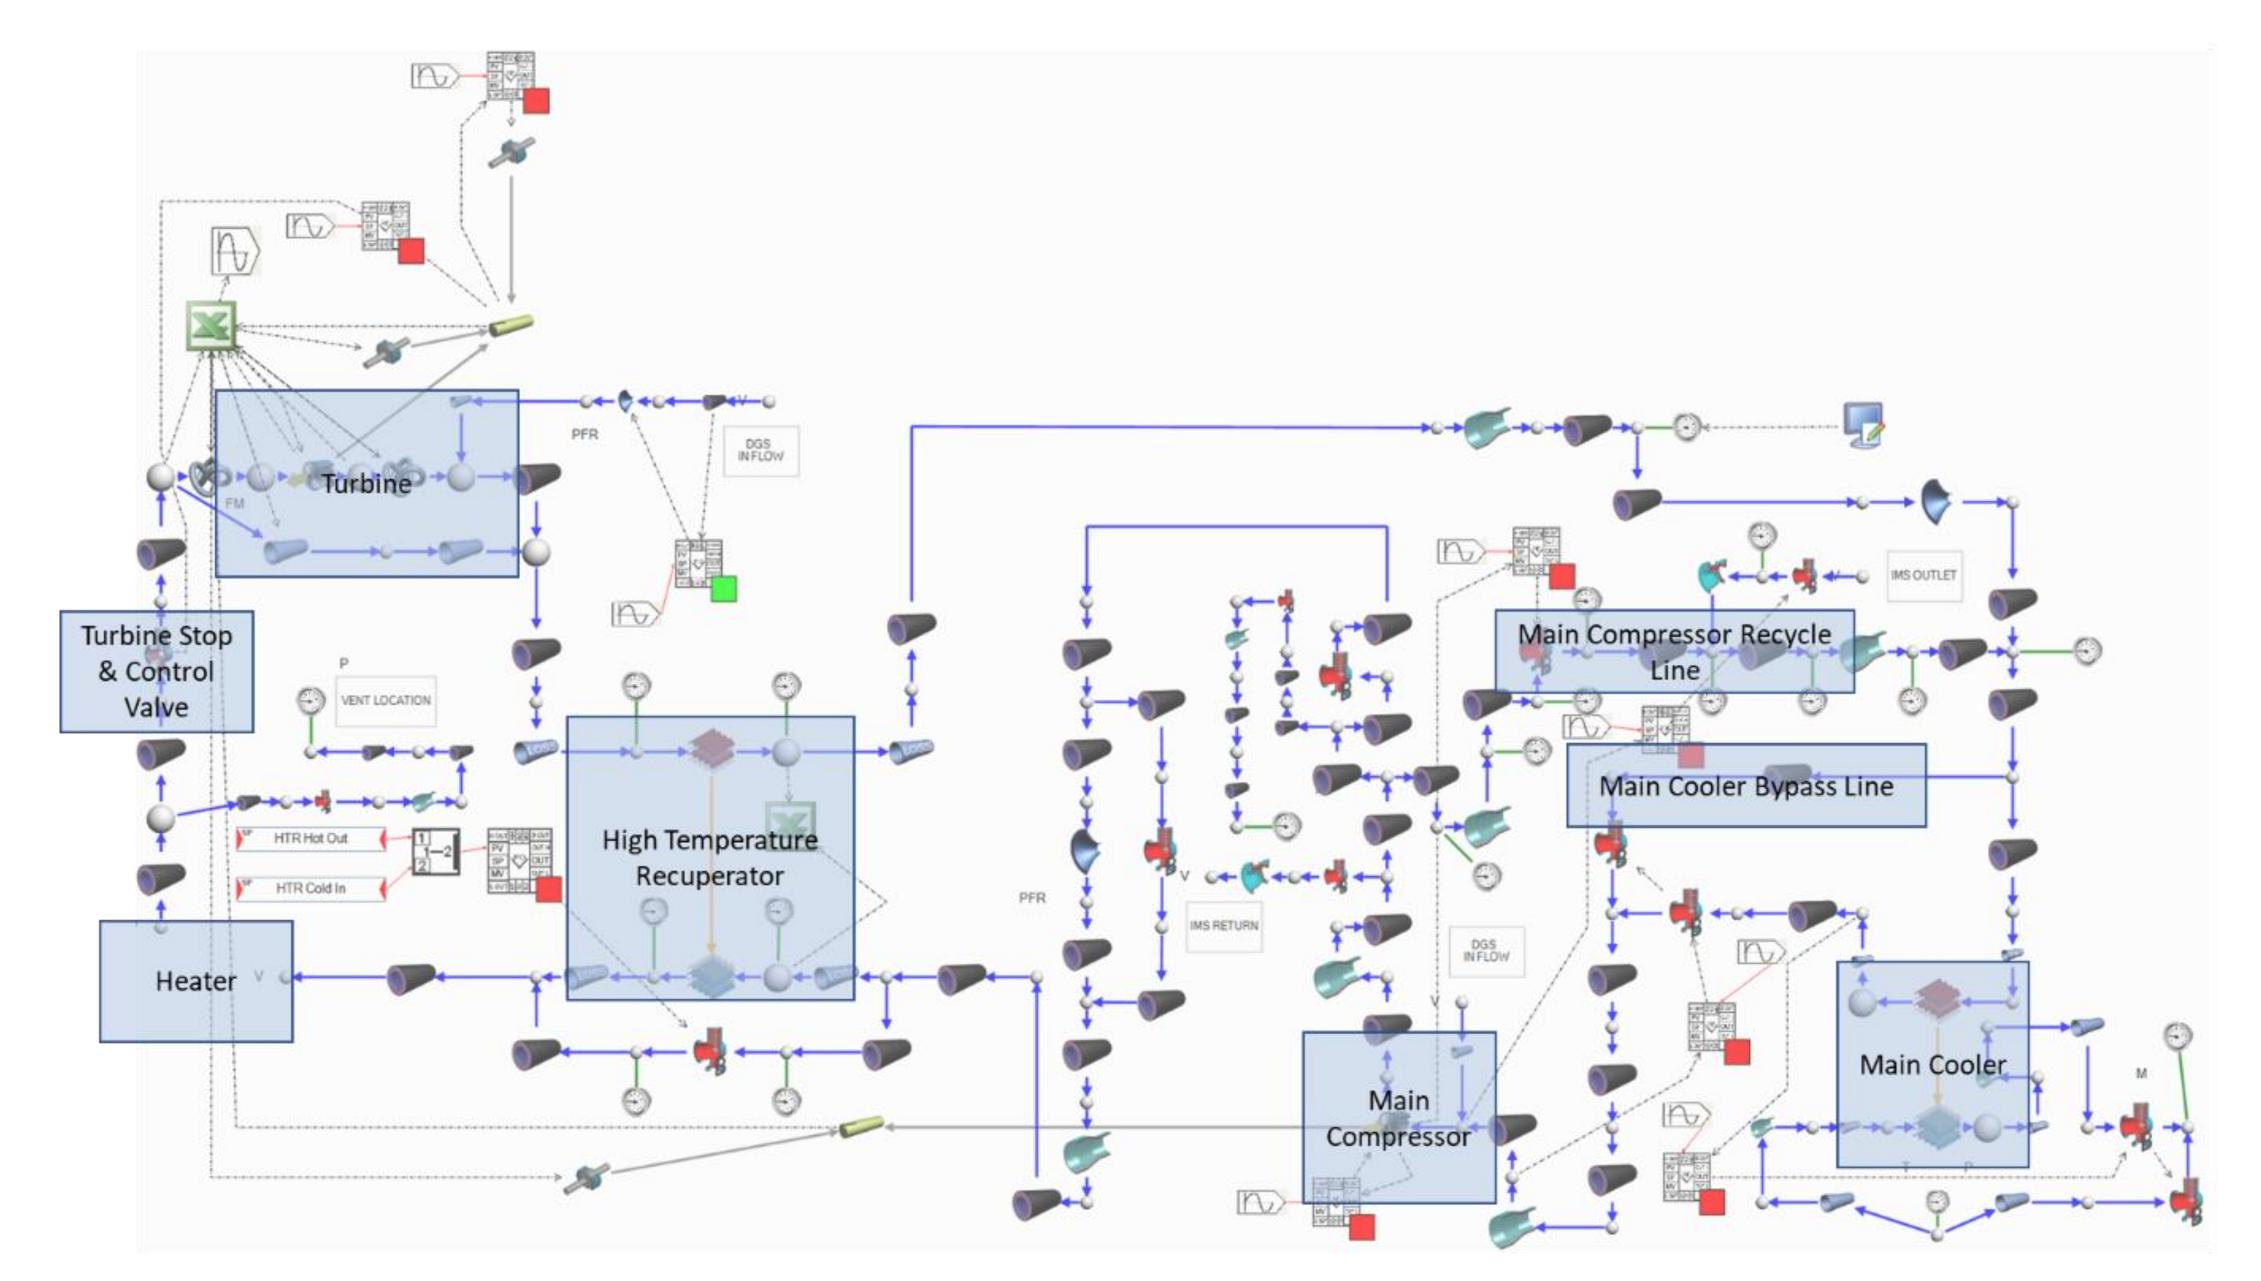

Flownex Simulation Environment (SE) is an object-oriented simulation environment that was developed in the late 1980's – ISO 9001:2015 and ASME NQA-1 compliant Allows for 1D integrated steady state and transient fluid flow and heat transfer system modeling to calculate pressure drop and heat transfer effects on the system Typical uses include analysis, design and optimization Flownex SE has been applied to various industries: Power, Gas Turbines, Aerospace, HVAC, Nuclear, etc

Flownex SE Overview

The 8th International Supercritical CO₂ Power Cycles • February 27 – 29, 2024 • San Antonio, TX, USA

Component Implementation: Turbine

a spreadsheet Turbine flow function are modeled

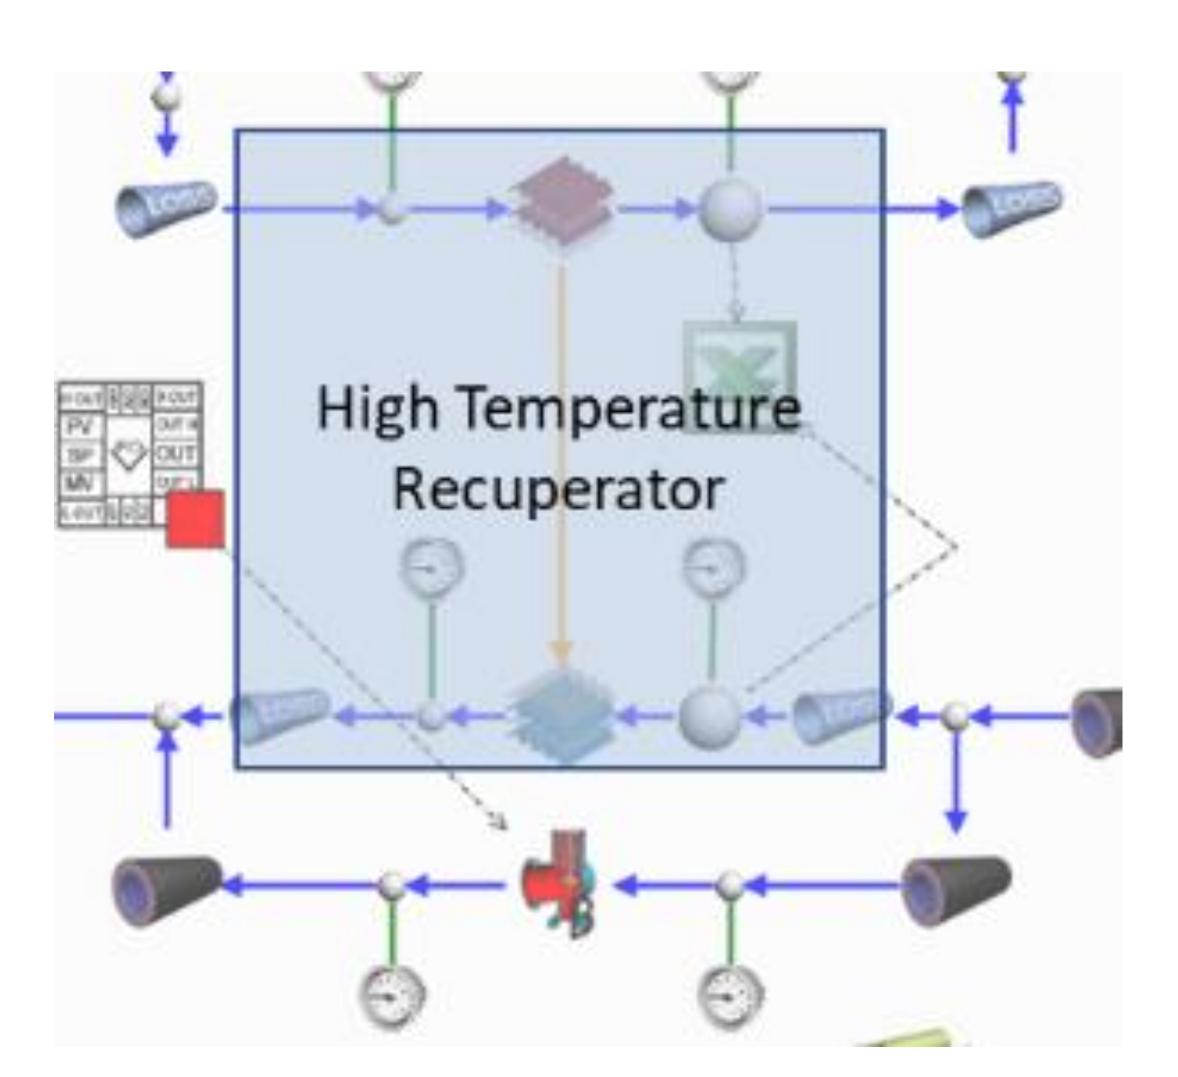

- STEP turbine is modeled through a combination of Flownex elements linked to
- Spreadsheet houses calculations such as:

 - Balance piston leakage
 - Inlet and exit pressure losses
- Dry gas seal flows coming from the IMS

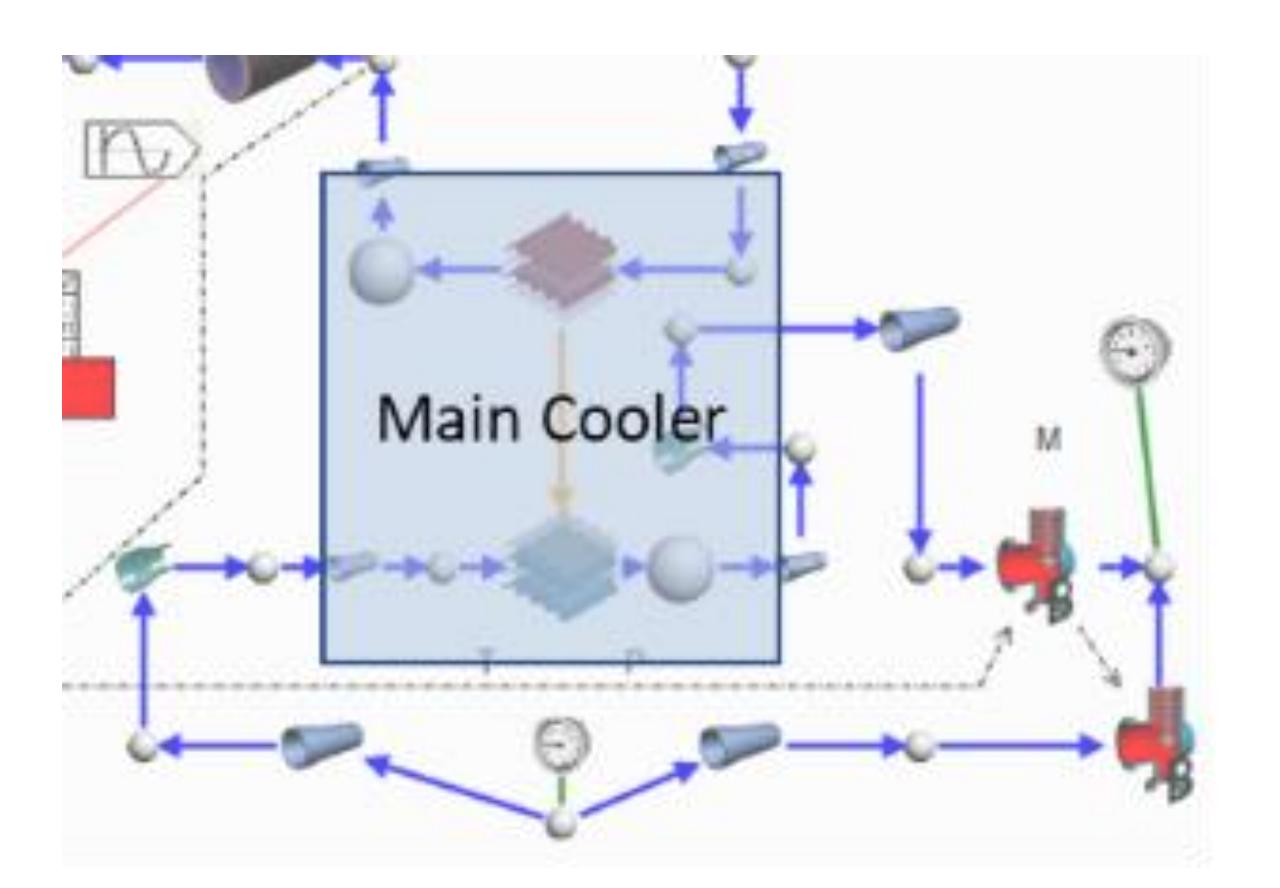

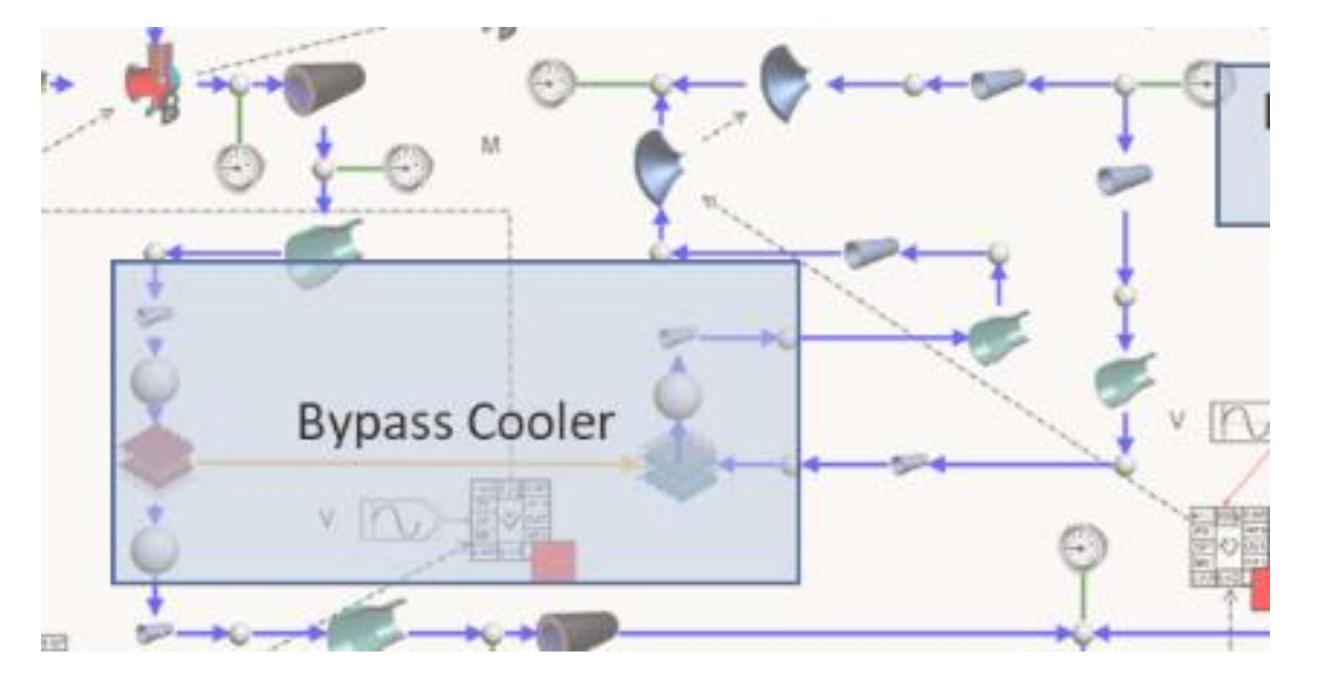

Component Implementation: Recuperators

High temperature recuperator, low temperature recuperator, main and bypass coolers are modeled using plate heat exchanger elements with customized heat transfer correlations Error deltas were <2% in predicted outlet temperatures and <0.2 bar in calculated pressure drops

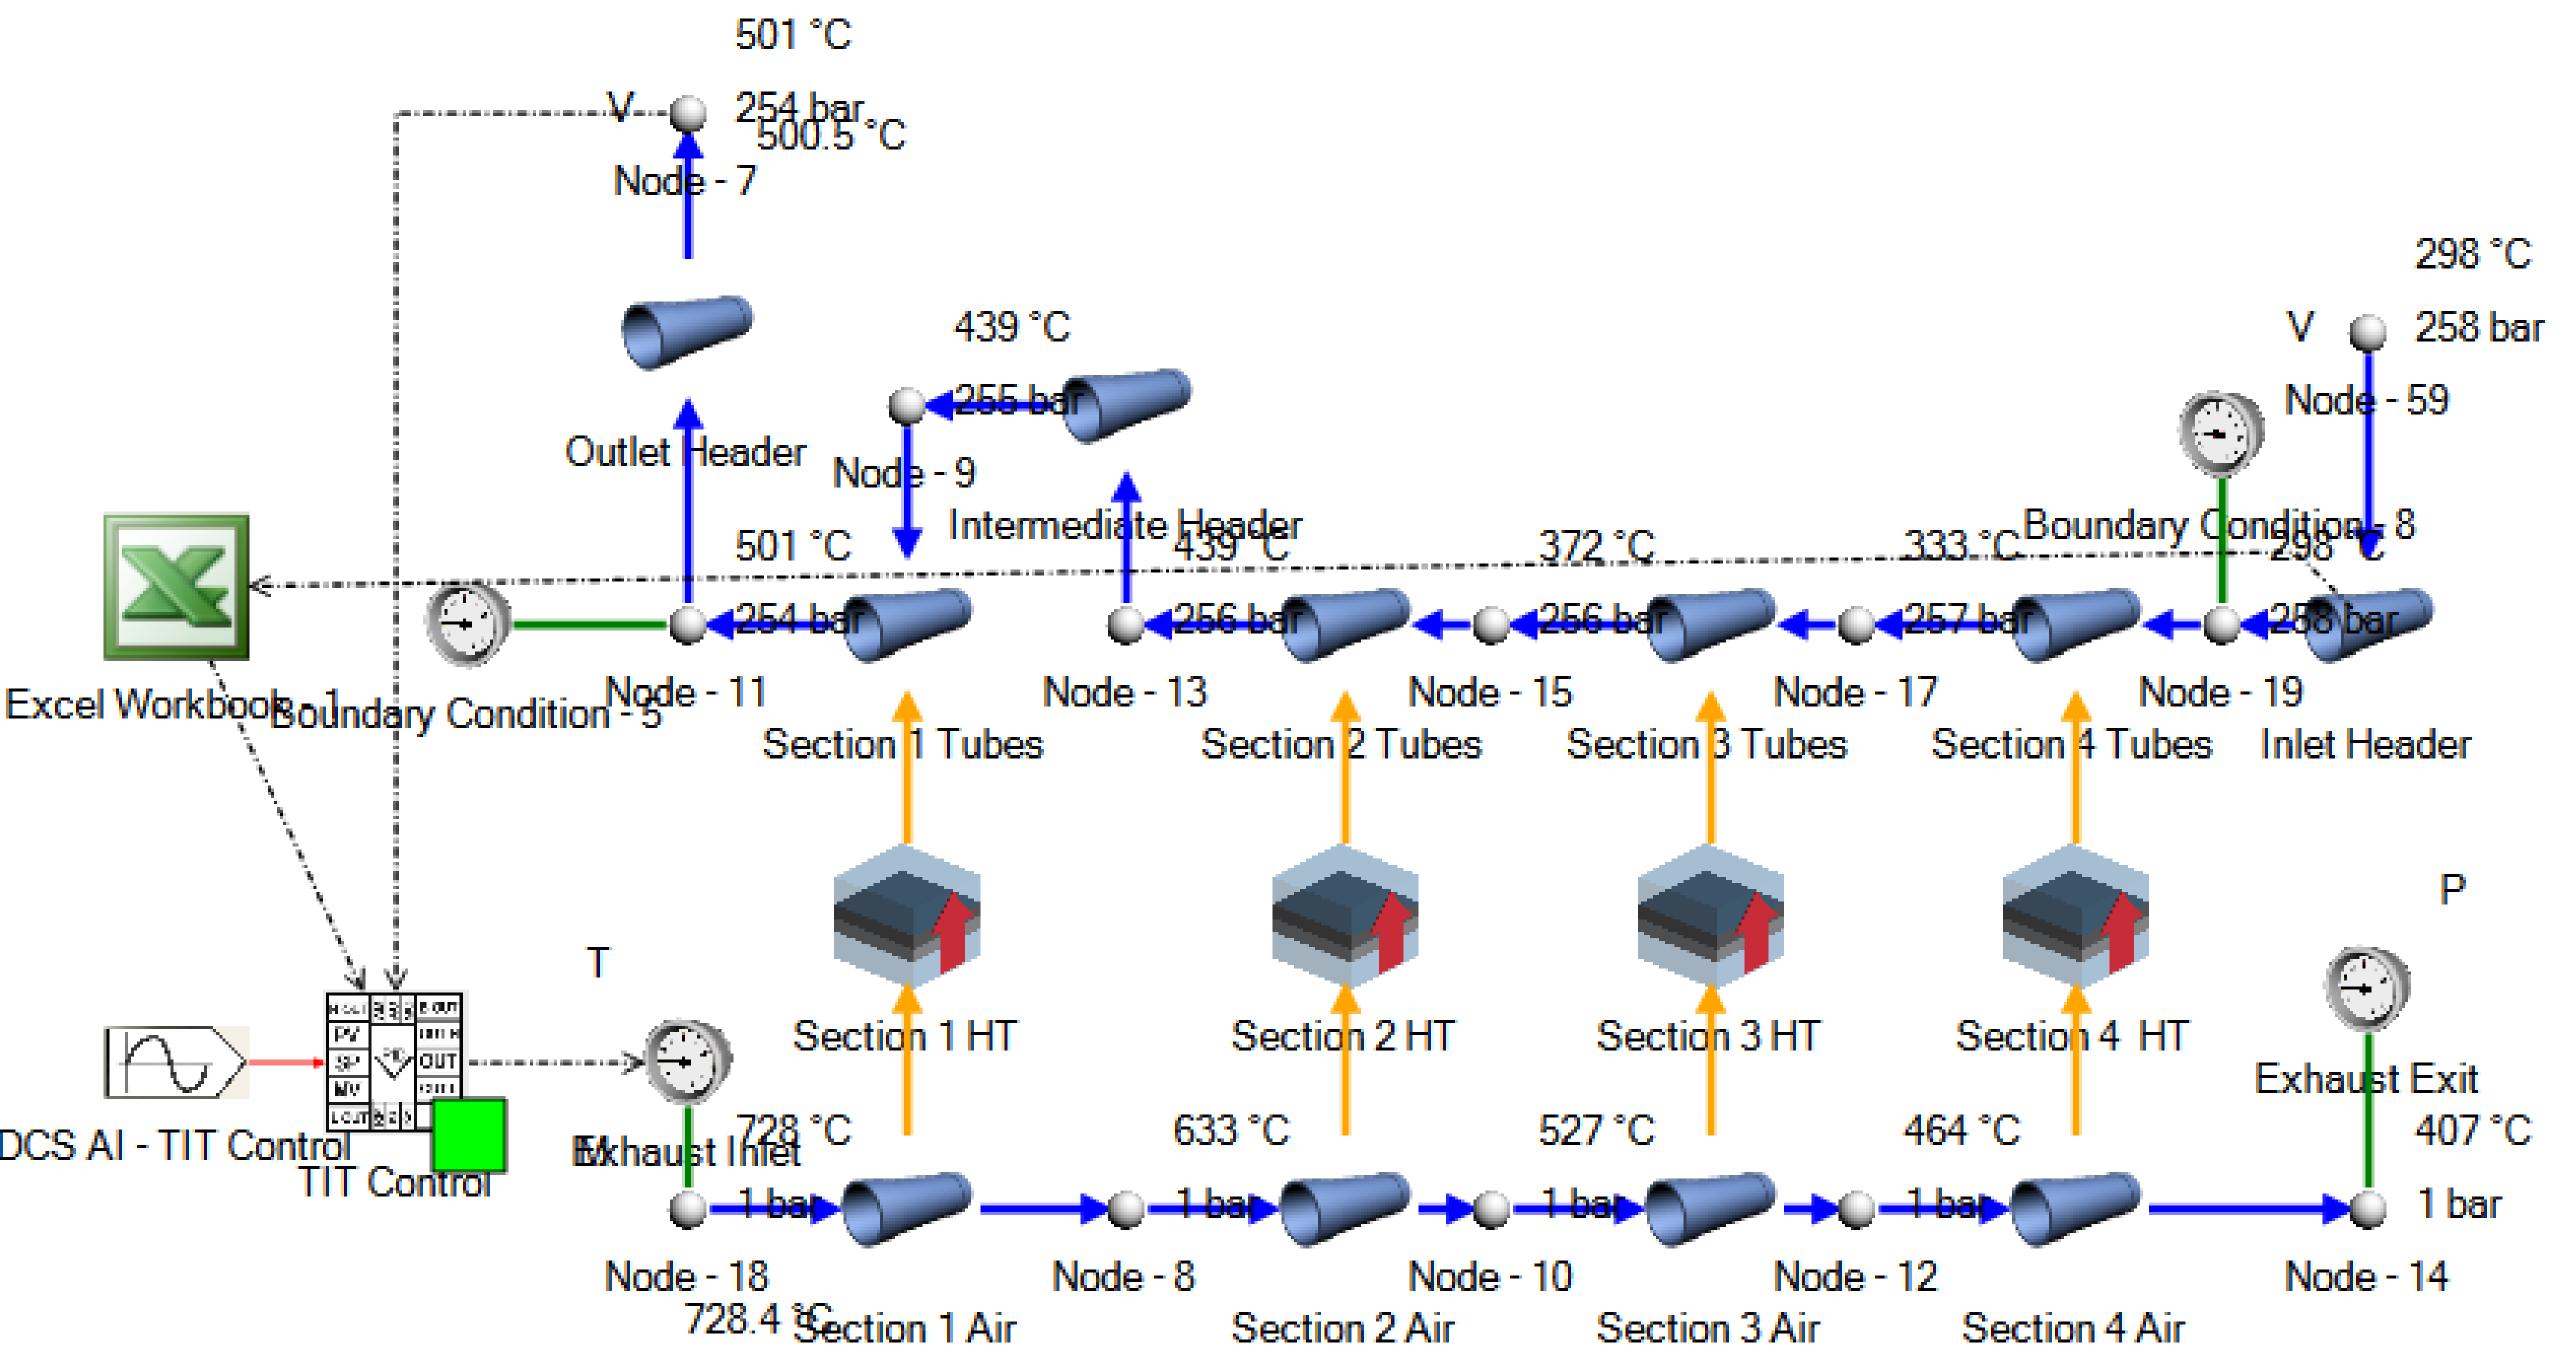

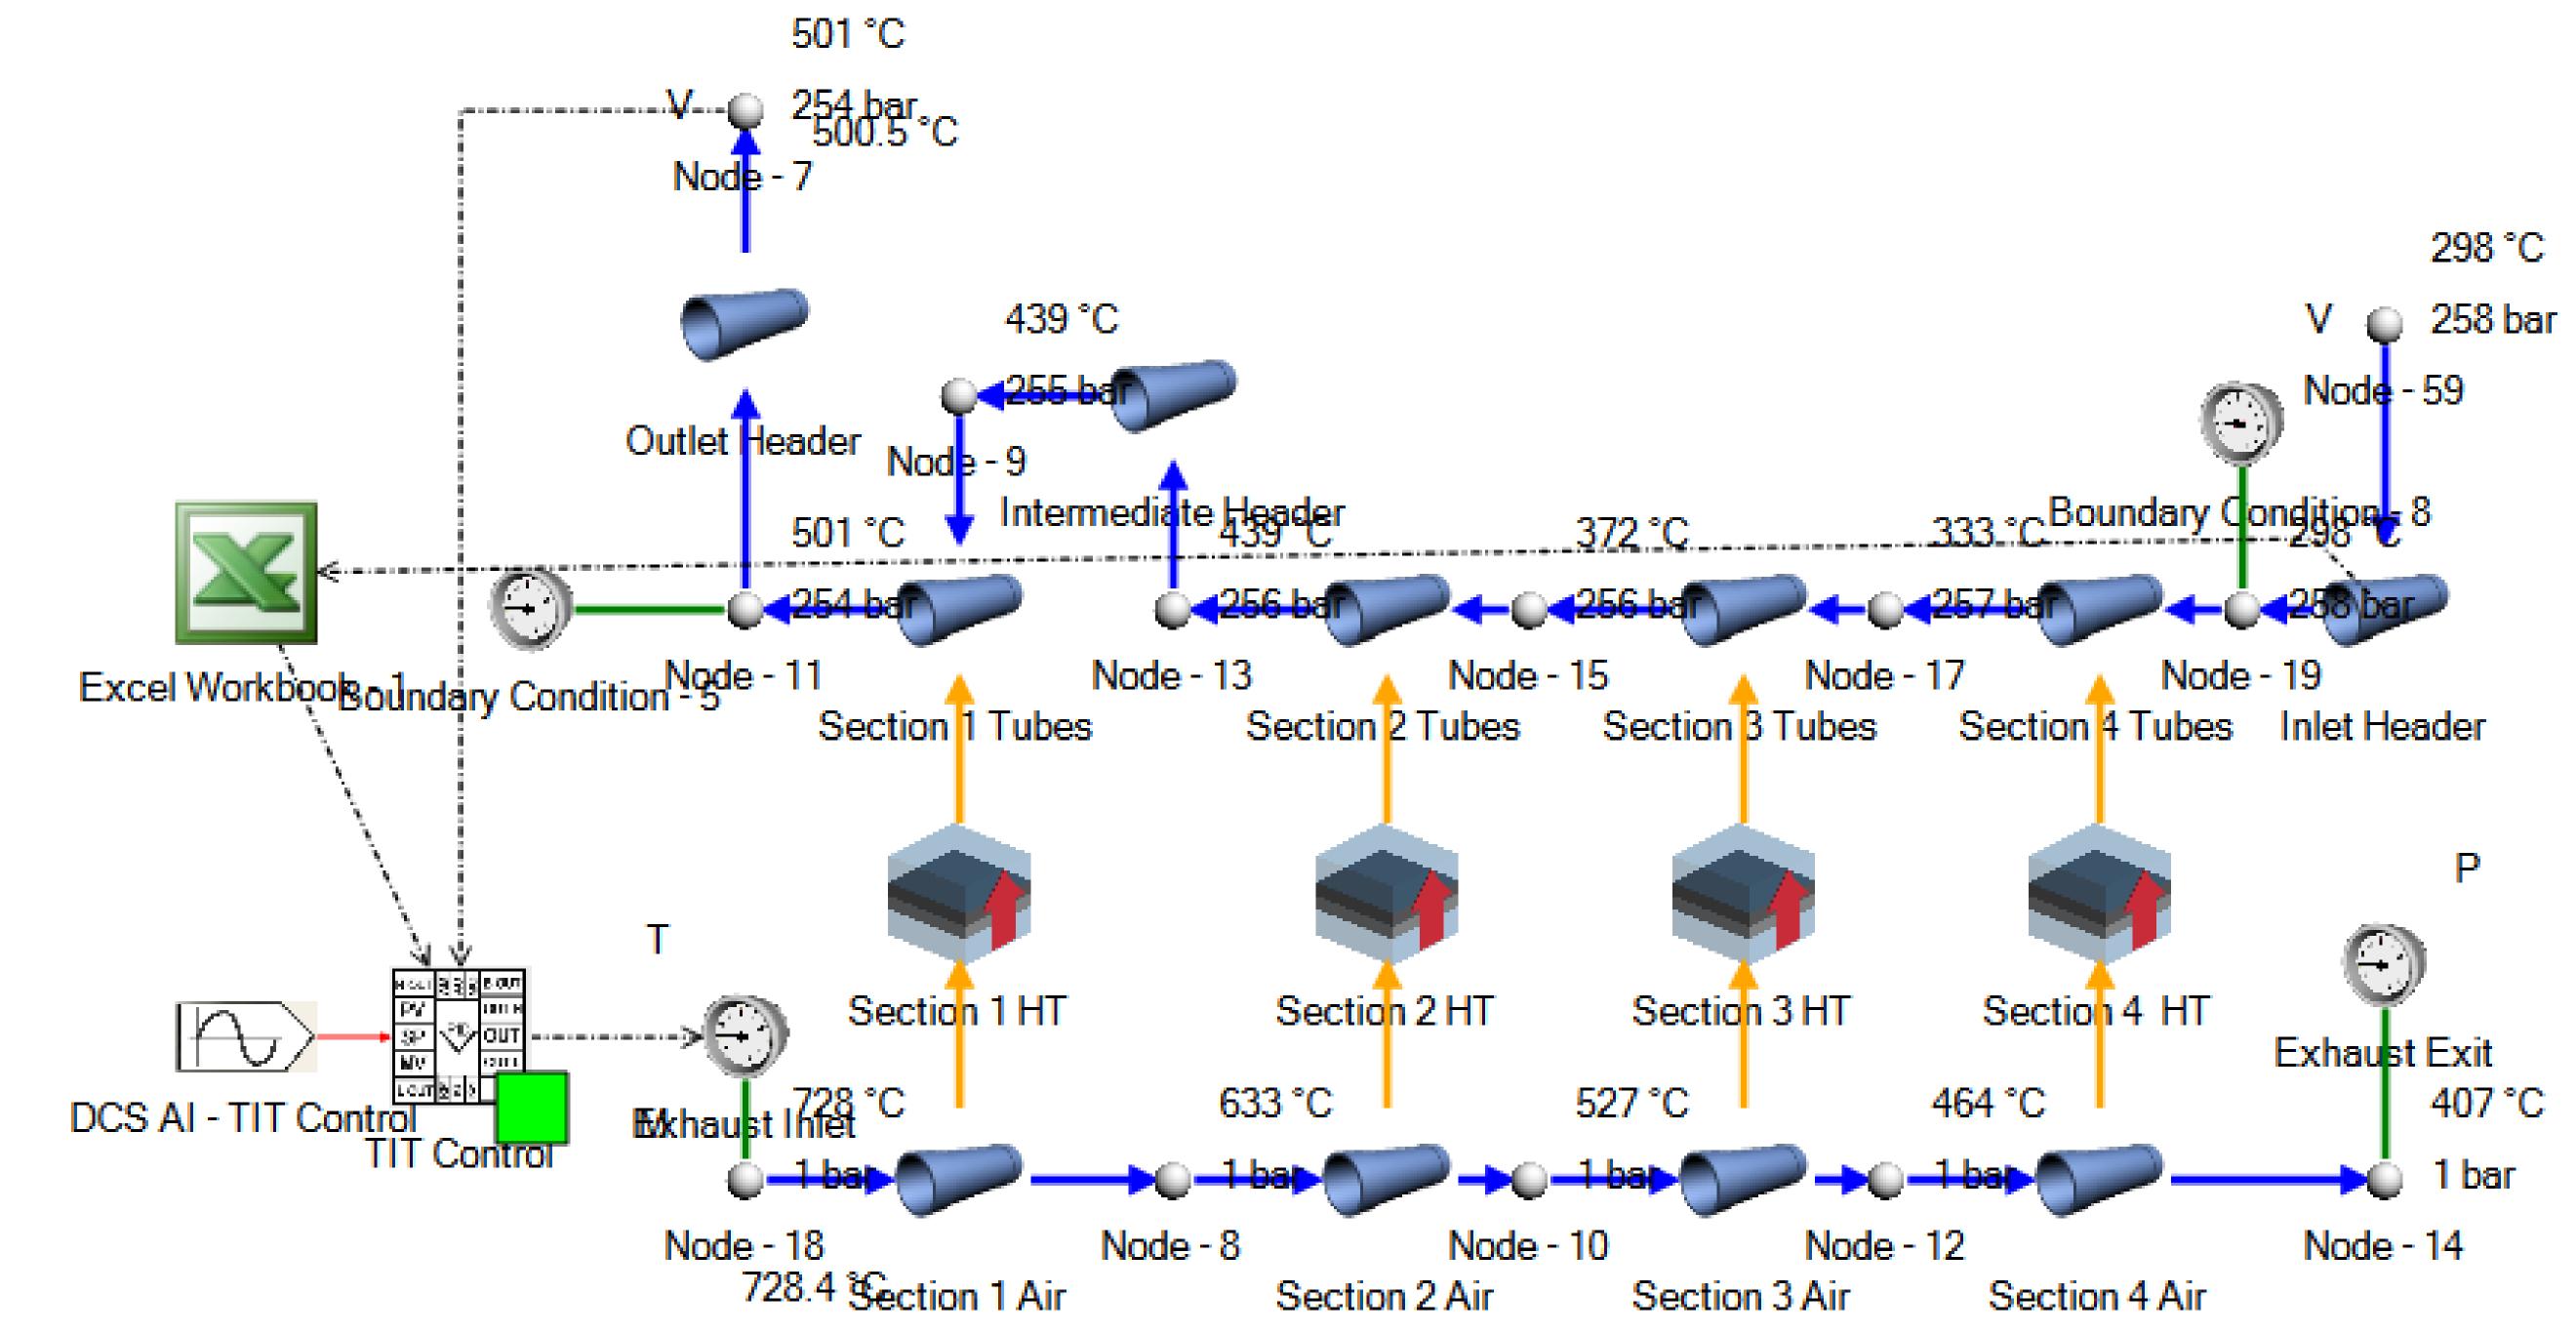

Component Implementation: Heater

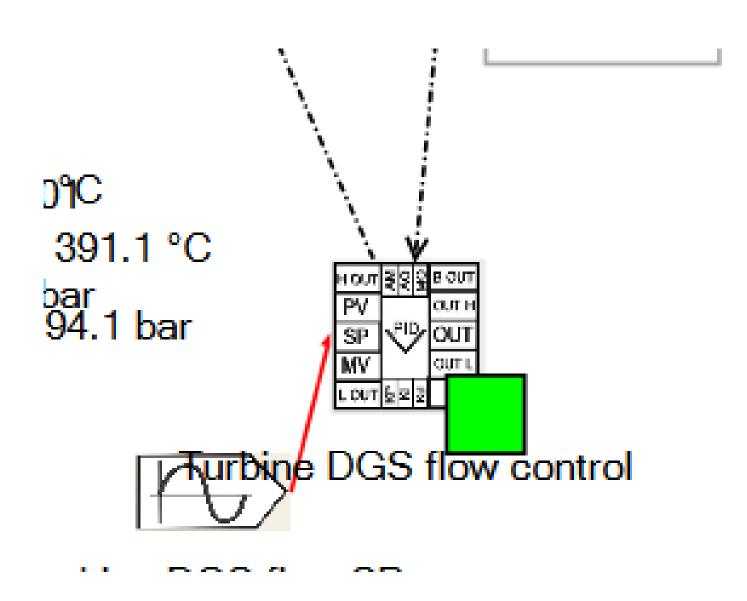

Heater has been modeled as a series of tubes with composite heat transfer elements Modeling only the heat exchanger portion of the heater

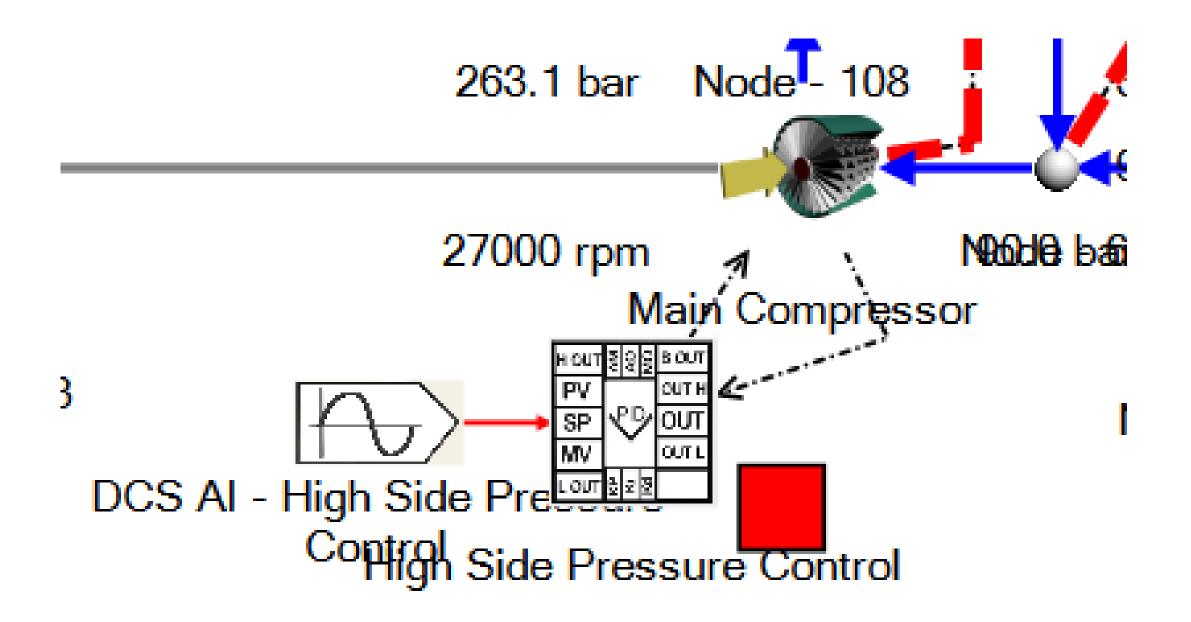

Component Implementation: PID Controllers & Compressors 17 total PID (proportional, integral, derivative) controllers in the model, used for

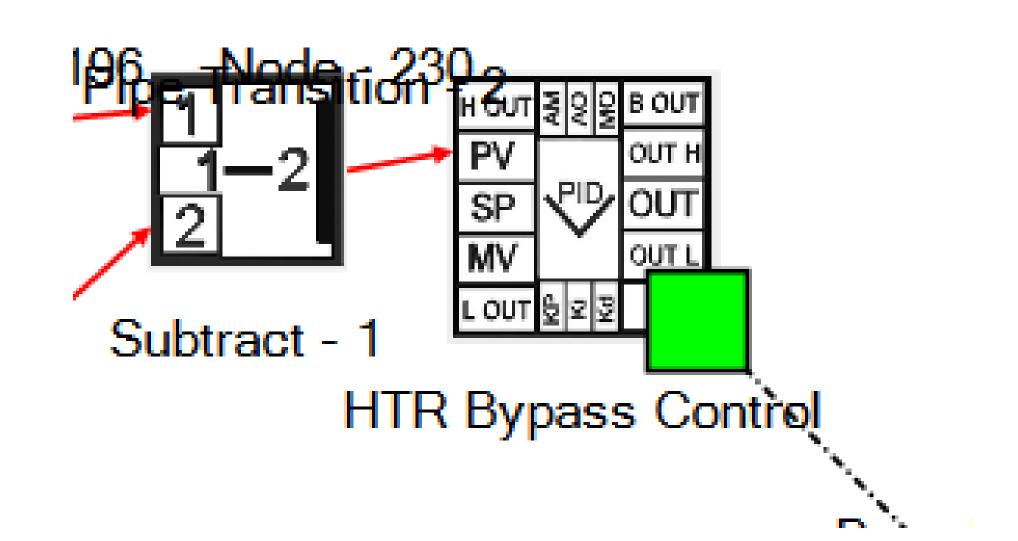

automatic or manual control

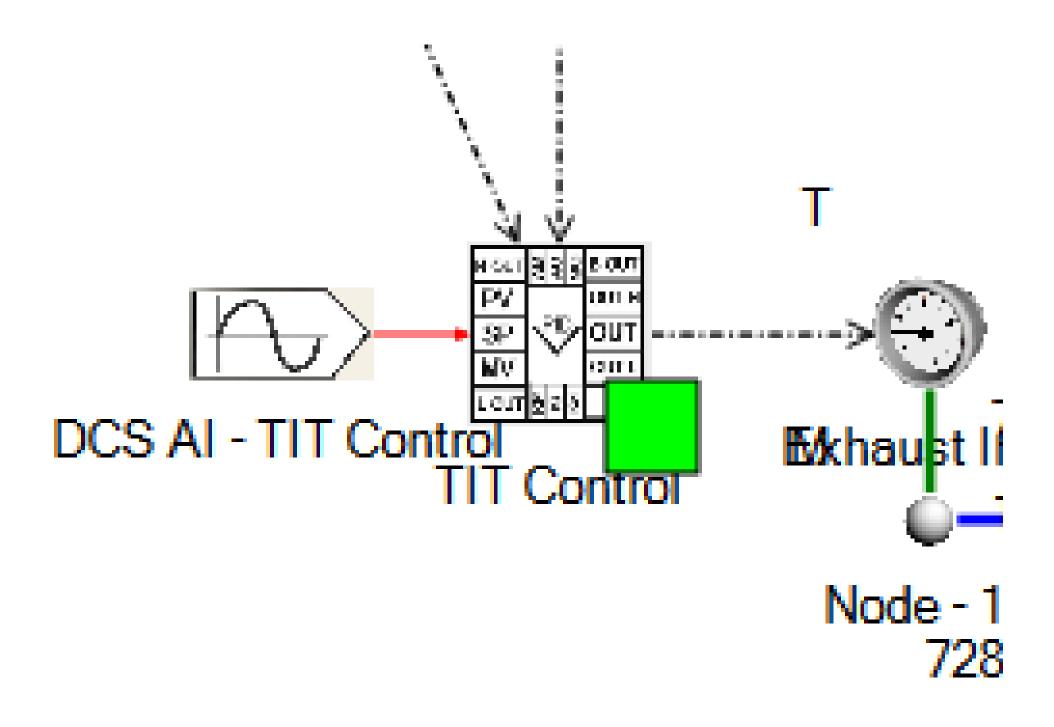

- Controlling speed, load, pressures, temperatures, mass flows

Compressors modeled using Flownex compressor elements Vendor compressor maps using real gas properties incorporated

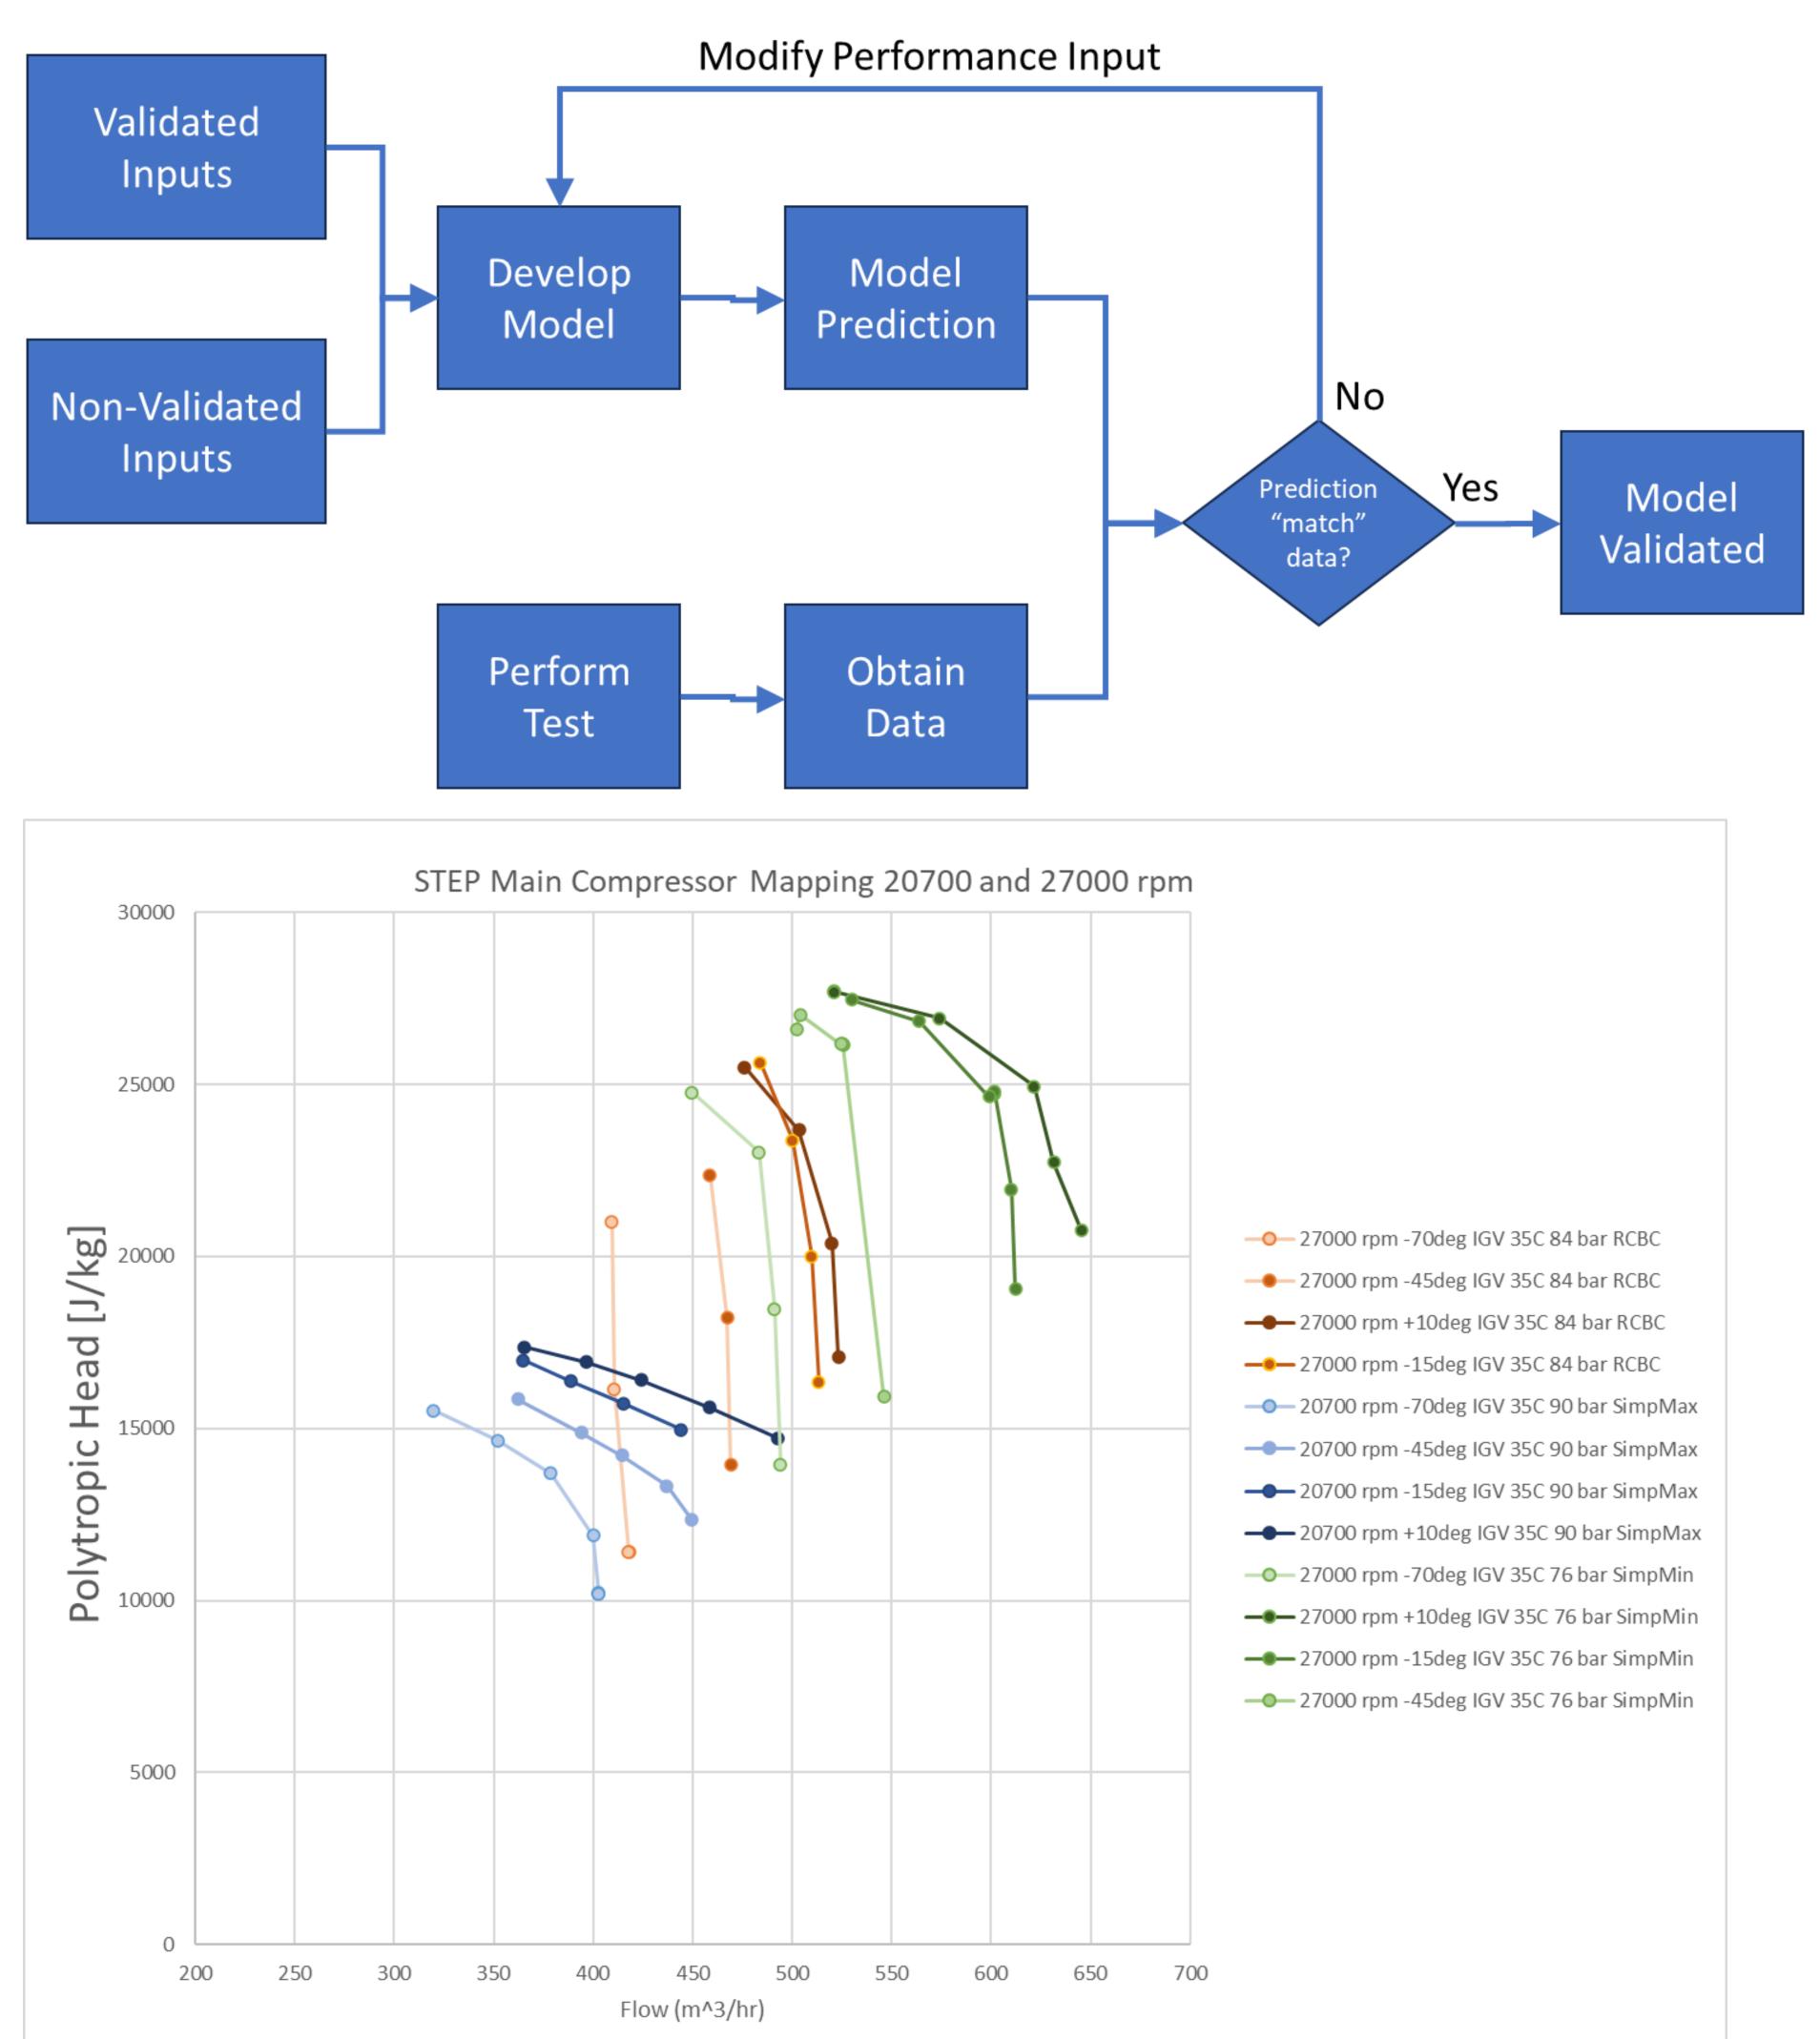

Simple Cycle major component commissioning efforts have been completed Main Compressor maps have been updated and incorporated into the steady-state and dynamic models

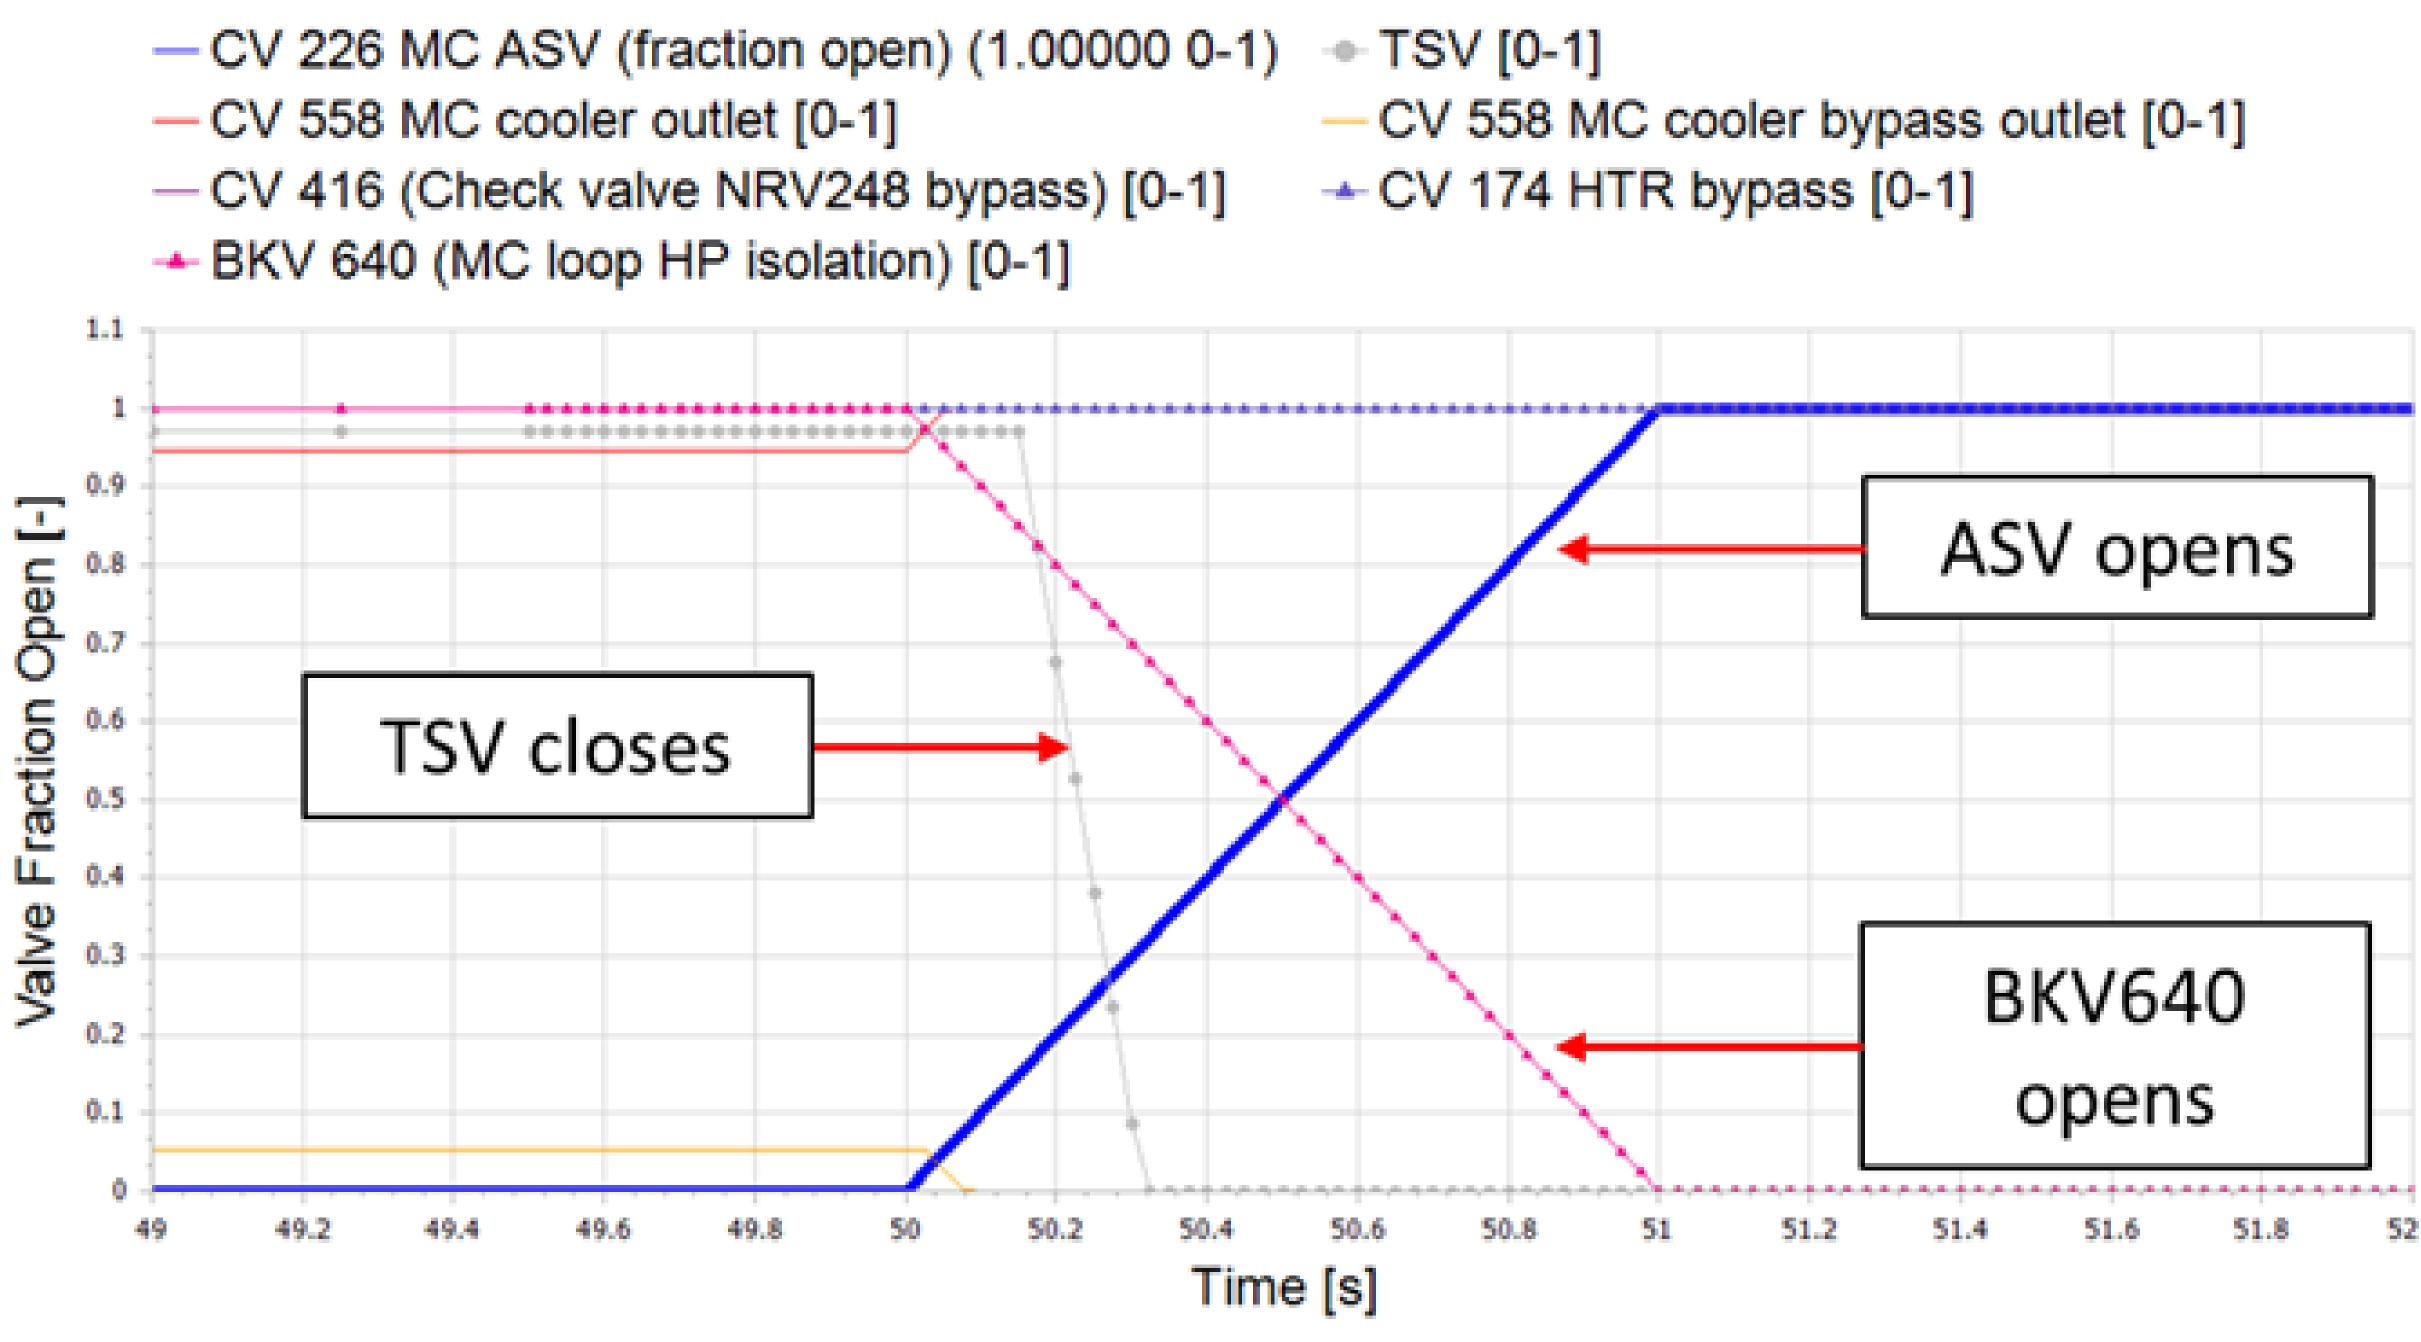

Test Validation Process

Application of Dynamic Model: Emergency Trip L3

One purpose of the dynamic model is to study and evaluate control methods and operational procedures for various scenarios Scenarios simulated include: Nominal Startup and Shutdown Load Level Changes **Emergency Trips** One example is the Level 3 **Emergency Trip simulation and results** – A Level 3 Trip is a manually activated shutdown trip sequence via the Emergency Shutdown (ESD) button It is intended to completely and rapidly deenergize the plant

The 8th International Supercritical CO₂ Power Cycles • February 27 – 29, 2024 • San Antonio, TX, USA

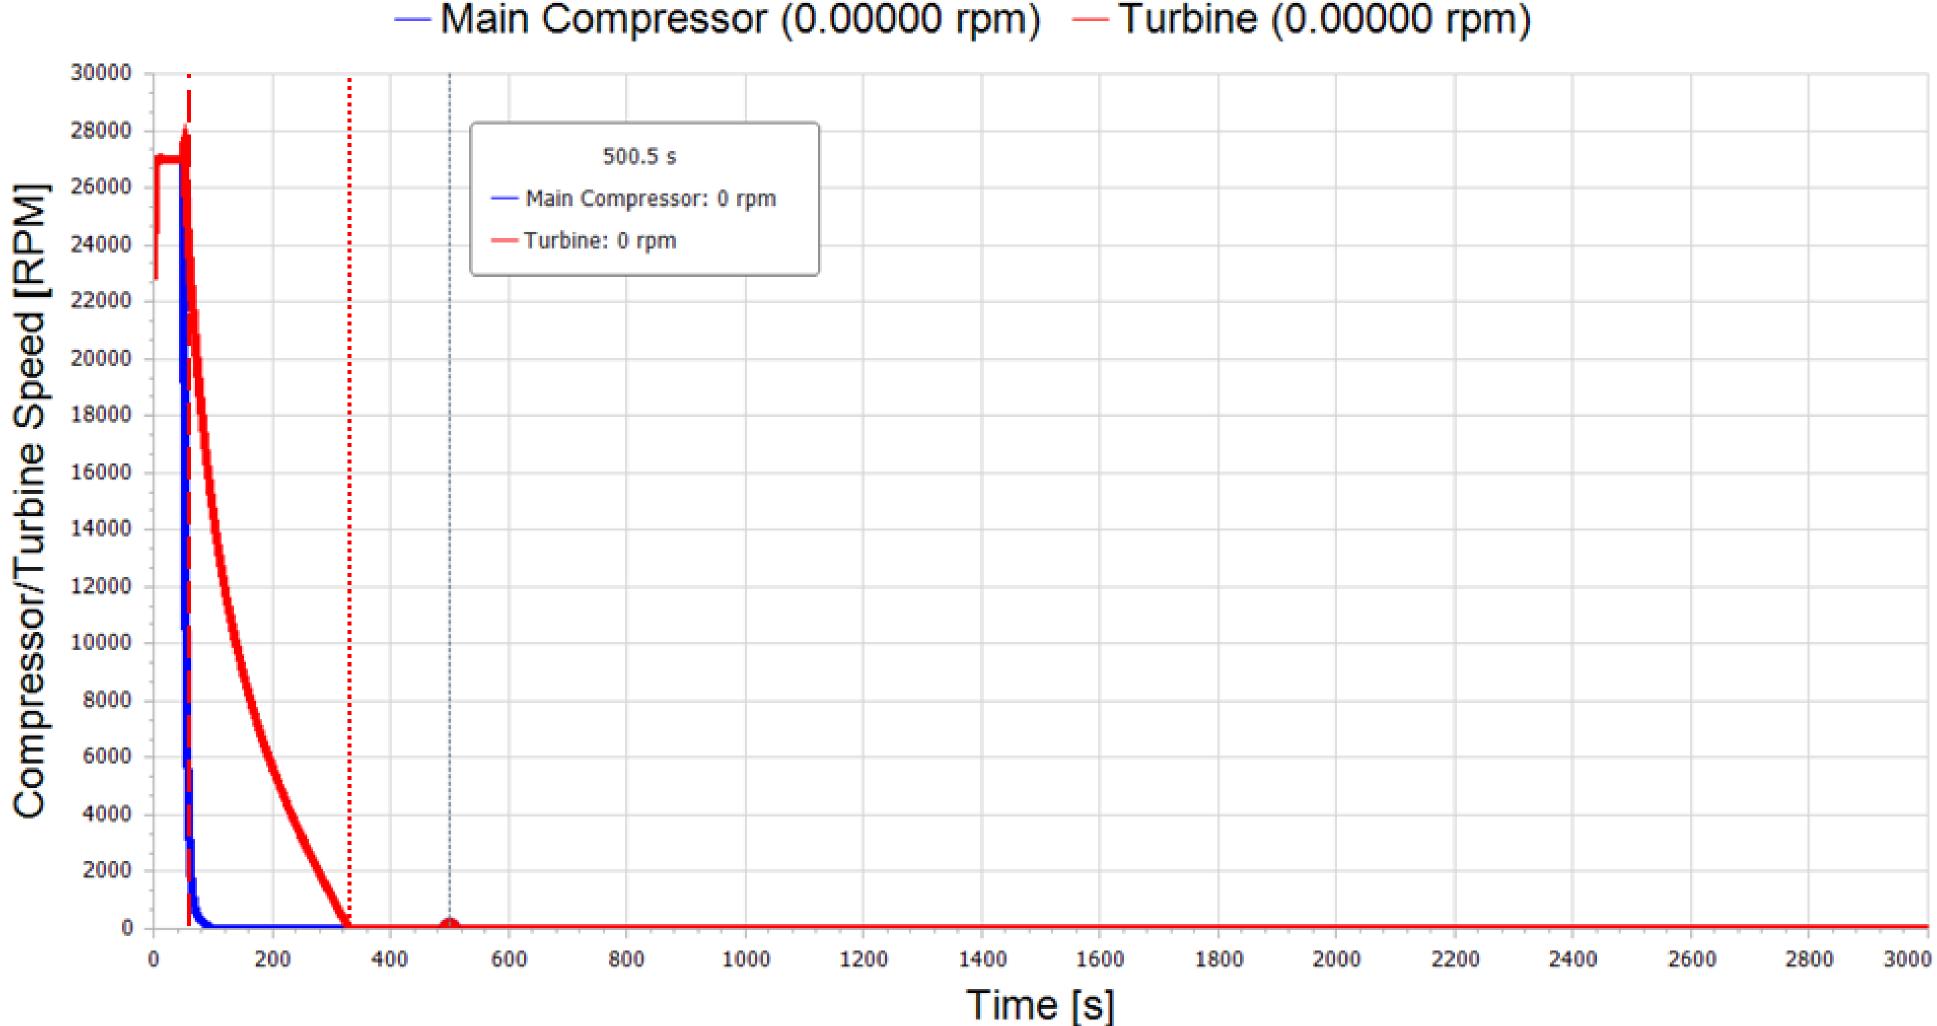

Level 3 Emergency Trip Valve Sequence

Results of Dynamic Model: Emergency Trip L3

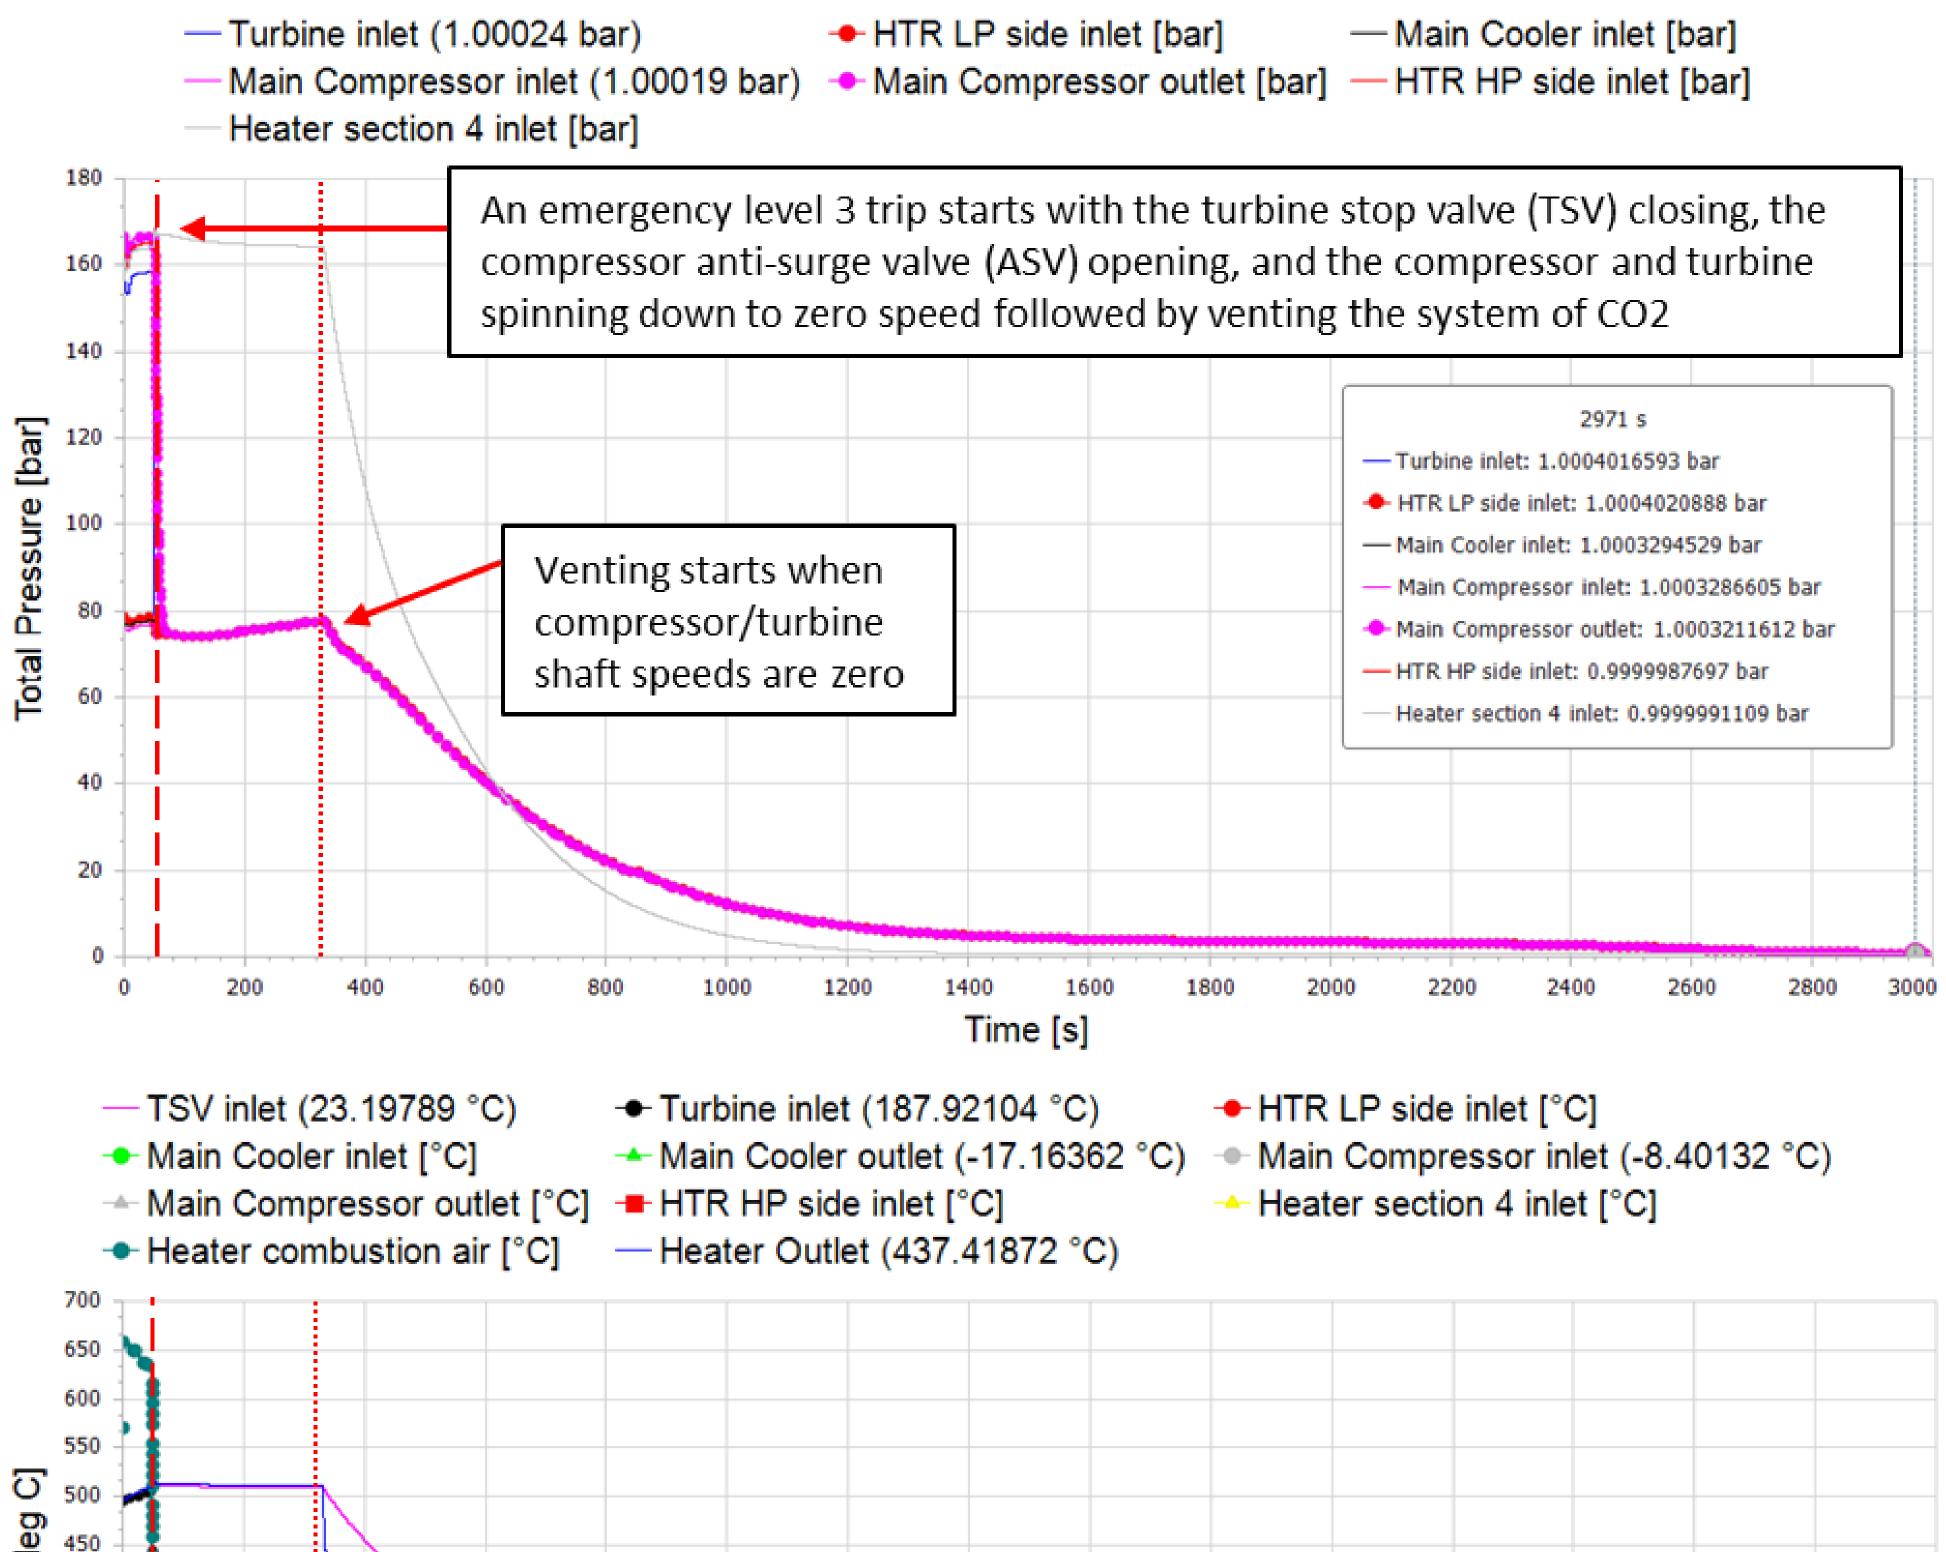

These plots illustrate the shutdown sequence and system response

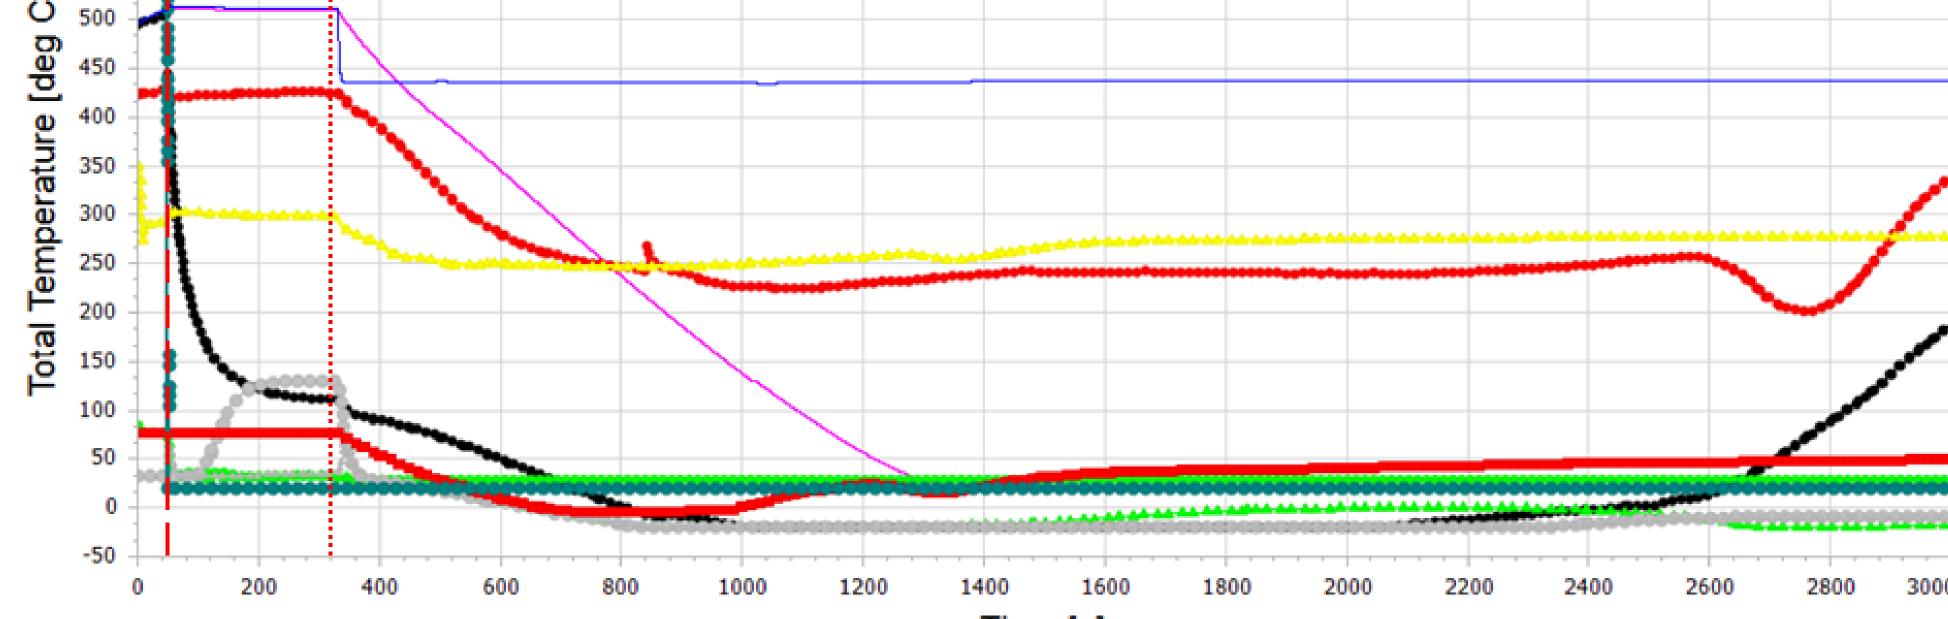

Showing Turbine and Compressor speeds, system pressures and temperatures

Simulation verifies all requirements are satisfied with current model assumptions

Applications of the Dynamic Model: Implementation of Digital Simulator

training

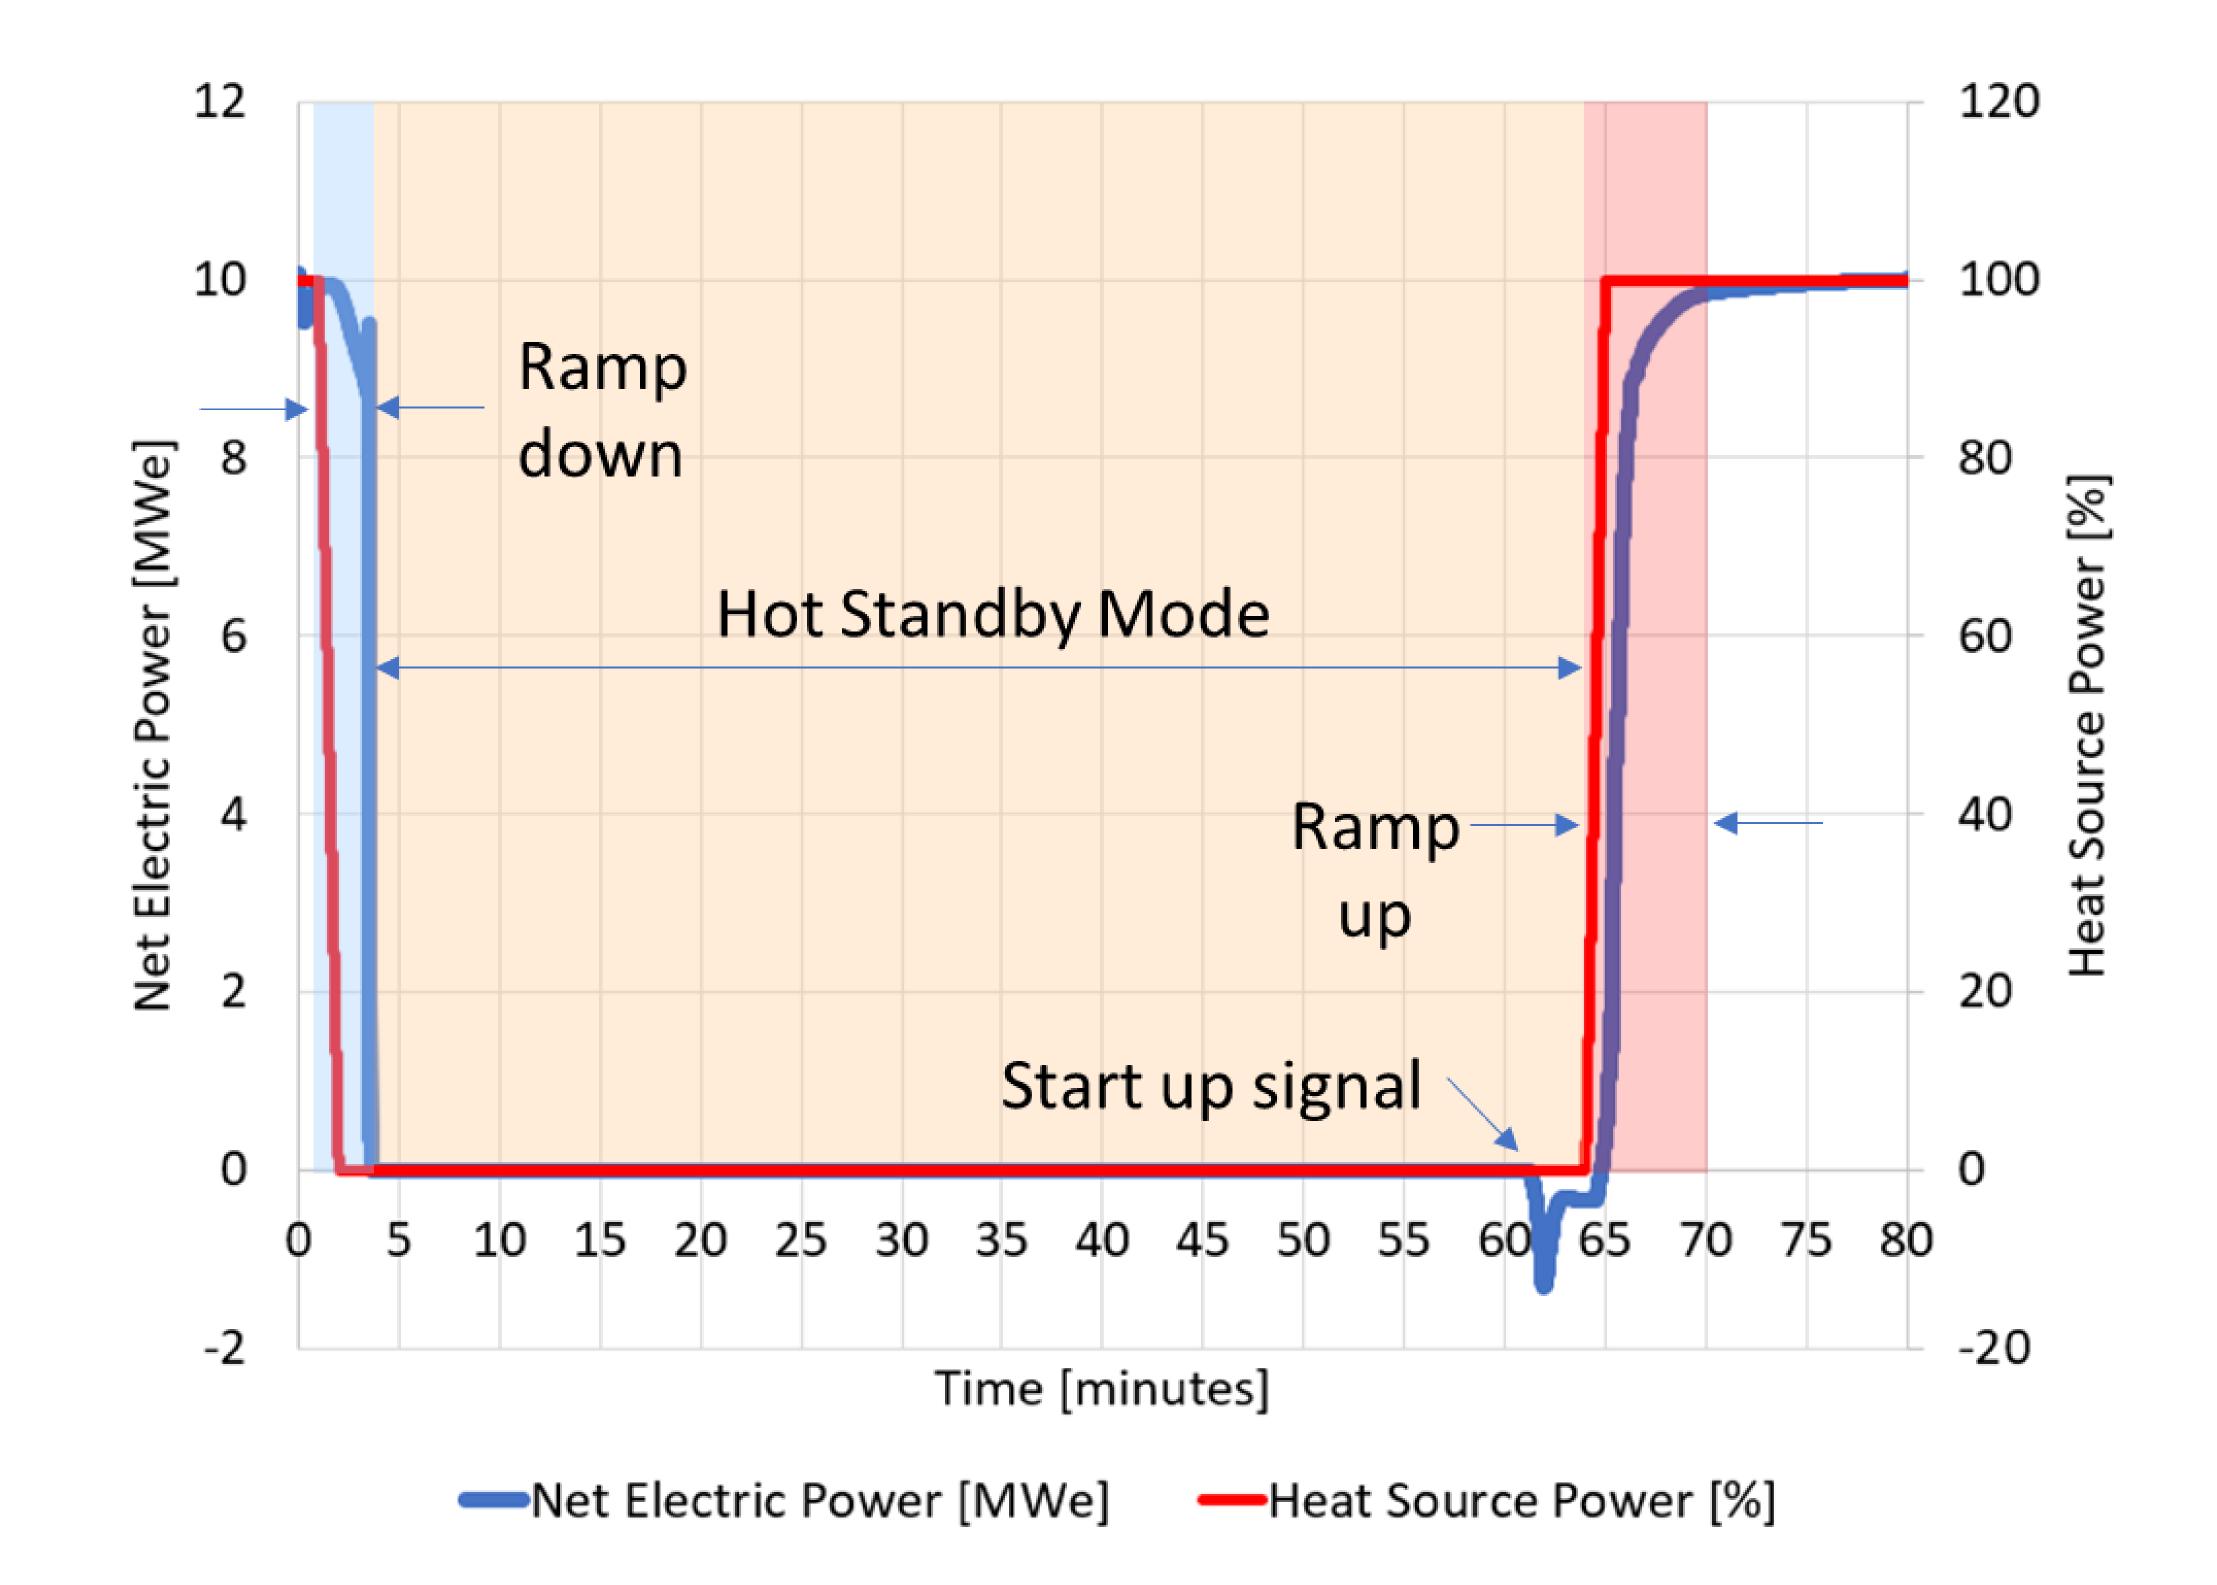

- A virtual digital Simulator has been developed for the STEP facility
- The Simulator development was completed in 2022, but has been paused with plans to reinitiate the simulator during RCBC commissioning The Simulator will be used during operational planning, preparation of operating procedures and operator

Applications of the Dynamic Model: **External Applications**

a sCO2 demonstration plant input: 3-hour at power, 1-hour off **Observations:** rotating equipment Power-Off: hot condition equipment by M. McDowell and J. Acres

- The dynamic model was successfully used to predict transient shutdown and startup events in
- This demonstration is to simulate a pulsed
 - Power generation pattern expected for the United Kingdom Atomic Energy Authority (UKAEA)
 - System shutdown is < 5min, paced by the inertia of the
 - Startup is < 5 min, paced by the inertia of the rotating
- Please refer to paper "Evaluation on the rapidity of sCO2 cycle power up and down events using the STEP dynamic simulation model," authored
